The **korigamik** class

Kushagra Lakhwani[a]

v1.10   June 24, 2023

Abstract

KorigamiK is a LaTeX class used for typesetting documents for university or school projects and lab reports. It is based on the article class with modifications to allow for more flexible front-matter among other changes. Please file bug reports and feature requests on the GitHub repository [b].

1 Usage

==== Put descriptive text here. ====

1.1 Package Options

nopar = ⟨*boolean*⟩   (default: `false`)
Changes the initial default separator between each paragraph of `\lipsum` from `\par` to `\space`, and the other way around for `\lipsum*`.

1.2 User Commands

`\lipsum` `\lipsum`⟨*⟩[⟨*par range*⟩][⟨*sentence range*⟩]

`\lipsum` outputs the ⟨*par range*⟩ from the currently active dummy text. If ⟨*par range*⟩ is not given or is empty, the default-range (initially `1-7`) is output. If a ⟨*sentence range*⟩ is given, the selected paragraphs are split into sentences, numbered starting from 1, and the specified range of sentences is taken out from those paragraphs. If the ⟨*⟩ version is used, a different set of separators is inserted around the paragraphs or sentences.

`\lipsum` changes the active language to that of the dummy text for typesetting, so the proper hyphenation patterns are used.
